ABSTRACT

Background: The prospective, observational study was designed to assess the prescribing pattern of drug usage in ENT outpatient department in various diseases conditions.

Methods: Medication utilization Form has been designed based on a WHO format. The patient’s details including patient particulars, diagnosis, investigations, drug details and information regarding the indication for prescribing agents.

Results: Total 200 prescriptions were analysed, 70% were males and 30 % were females, respectively. The most common disease reported was CSOM in 31 (15.5 %) patients followed by otitis externa 25 (12.5%), pharyngitis 21 (10.5%), URTI patients 20 (10.0%). Antibiotics used were: amoxicillin-clavulanate 200 (57.3%), cefixime 37 (10.6%), levofloxacin 34 (9.74%), cefixime clavulanate 30 (8.59%), cefuroxime 13 (3.72%). The most commonly used NSAID are diclofenac and paracetamol.

Conclusions: Prescribing pattern of usage of antibiotics are more compared to other drugs, amoxicillin with clavulanic acid are most commonly prescribed antibiotics in various ENT diseases, usage of brand name are higher than the generic name.

Keywords: Antibiotic, Drug utilization, ENT

INTRODUCTION

Disease of the ear, nose and throat (ENT) is very common problems in adults and children will cause impairment of routine life. It was observed increased global population that, hearing loss is very common especially in children due to upper respiratory tract infections (URTIs). The world health organization (2004) estimated that respiratory infections 94.6 disability adjusted life years lost worldwide.1,2 The commonly used drugs for the URTI are antibiotics like amoxicillin, amoxicillin+clavulanic acid, cefixime, cefuroxime.3 The different surveys were showing that antibiotic prescriptions are made in approximately 40% of all consultations for rhino pharyngitis and in 80% of acute bronchitis.4 It is very important to analyse and monitor the prescribing patterns of drug used time to time, the basic drug modification in prescribing pattern to improve the therapeutic value and reduces the side effects. These types of studies will help full for medical professionals to prescribing pattern of antibiotic rationally and therefore are extreme needed. Here the present demonstration has been designed to express the usage of antibiotic in ENT department of LSLAM government medical college and hospital, Raigarh, Chhattisgarh, India Based on the study results appropriate interventions at the level of the physician and the Institute can be planned to promote rational use of drugs in our set up.
METHODS

The prospective, observational study was conducted in 200 patients who visited the OPD of ENT department of LSLAM government medical college and hospital, Raigarh, Chhattisgarh, India in the period of January 2016 to December 2016 after obtaining approval from the institutional ethics committee and medication utilization form has been designed based on a WHO format. The patient’s details including patient particulars, diagnosis, investigations, drug details and information regarding the indication for prescribing agents (both topical and oral). The information was compiled and analyzed in consultation with ENT specialist.

Inclusion criteria

Inclusion criteria of present study were: patient attending ENT OPD and giving consent to participate in the study.

Exclusion criteria

Patient who were seriously sick (emergency) and IPD patients. Who prescribes indicators:

- Average number of drug prescribed per patient
- Percentage of encounters with an antibiotic prescribed
- Percentage of encounters injection
- Percentage of drugs prescribed by generic name
- Percentage of drug from essential drug list.

RESULTS

The study was conducted the period of 12 months, based on inclusion and exclusion criteria specified, a total of 200 prescriptions were studied out of 200 patients, 70% were males and 30 % were females, respectively.

Highest number of patients was in the age group of 15-25 years followed by the age group of 5-15 years and 25-30 years (Table 1).

The present study observed that, the most common disease reported was CSOM in 31 (15.5%) patients followed by otitis externa 25 (12.5%) patients, pharyngitis patients 21 (10.5%), URTI patients 20 (10.0%) as in Table 2.

Antibiotics used in present study as follows amoxicillin-clavulanate 200 (57.3%) patients followed by cefixime 37 (10.6%), levofloxacian 34 (9.74%), cefixime clavulanate 30 (8.59%), cefuroxime 13 (3.72%) patients and remaining drugs usage was less (Table 3). The other than the antibiotics, the most common drugs used was a phenylephrine, paracetamol, levocetirizine, mucolyte, diclofenac, multivitamin. The most common NSAID used was diclofenac and paracetamol and antibiotic was amoxicillin-clavulanate.

DISCUSSION

The Drug prescribing in ENT practice, the therapeutic approach for ENT infections is empirical. The present study reveals that the general trends of prescribing pattern of antibiotic in the OPD of ENT department. A total number of 200 patient prescriptions were analysed and the demographic data showed that percentage of males suffering from ENT infections was more than females. Earlier study findings were also reported that the higher percentage of males suffering from ENT infections.

In the present study, we are demonstrated and analysed out of 200 patients, total number of drugs prescribed was 700 and total antibiotics were 349. Average number of drugs per prescription was 3.30 and average antibiotic prescribed per prescription was 1.66. 258 antibiotics were prescribed by oral route and topical route prescribed by 91.

In a similar study reported antimicrobial agents prescribed in outpatient services of ENT department. In the present study, male patients were encountered more compared to females. In contrast, another study reveals that, female patients are suffering from ENT infection were more than their male counterparts.

The maximum ENT infections are more prevalent in young adults in the age group of 15-30 years and similar finding were reported in previous studies. Macrolides, antifungals, and lincosamides are least commonly used drugs in present study and this was accordance with who was earlier found of most common class of agents used were beta-lactams, followed by quinolones. We have found that the therapy given was based on clinical knowledge and experience and was empirical, but rational in accordance with the literature available. An average number of drugs per prescription are an important finding for assessing rationality. Hence, it is necessary to keep the mean number of drugs per prescription as low as possible to reduce the risk of drug interactions, development of bacterial resistance and cost of drugs per prescription. The present study analysed that to
improvement is required in the prescribing patterns of ENT diseases to depreciate use of drugs. It was found that maximum of the drugs were prescribed in their brand names, highlighting physicians trust over brand names despite knowing the low cost of generic drugs. Usage of generic drugs is helpful to decreasing the cost of therapy and avoiding medication errors.

CONCLUSION

Present study reveals that, usage of antibiotics are maximum compared to other drugs, amoxicillin with clavulanic acid is the most commonly prescribed antibiotics for various acute and chronic ENT infections, usage of brand name are more than the generic name.
